

AMENDMENTS TO THE CLAIMS

1. (Original) A protecting apparatus for protecting a structure from an impact, said protecting apparatus including a bumper member arranged in use to receive an impact force, a structure positioning member arranged to be positioned in contact with or adjacent to a portion of the structure, a first joining member joining a first end of the structure positioning member to a first end of the bumper member and a second joining member joining a second end of the structure positioning member to a second end of the bumper member so that said structure positioning member and said first and second joining members define an opening for receiving at least said portion of the structure and at least one resiliently flexible joining portion extending between said bumper member and said structure positioning member arranged so that when an outer surface of the bumper member is impacted said impact force is dissipated at least in part by flexure of said at least one joining portion.

2. (Original) A protecting apparatus according to claim 1 wherein said impact force is further dissipated by flexure of said bumper member and/or flexure of said structure positioning member and/or fracture of said at least one joining portion.

3. (Previously presented) A protecting apparatus according to Claim 1, wherein said at least one resiliently flexible joining portion adopts a tortuous path between the bumper member and the structure positioning member

4. (Currently amended) A protecting apparatus according to claim 3 1 wherein the tortuous path is curved so as to ~~minimise~~ minimize any points of stress concentration along said path.

5. (Previously presented) A protecting apparatus according to claim 1 wherein said first and second joining members join to said bumper member and said structure positioning member at respective zones of connection so as to minimize stress concentrations in the protecting apparatus.

6. (Previously presented) A protecting apparatus according to claim 1 wherein the first and second joining members each adopt a tortuous path between the respective ends of the positioning member and the bumper member.

7. (Original) A protecting apparatus according to claim 6 wherein the first and second joining members are resiliently flexible.

8. (Original) A protecting apparatus according to claim 7 wherein the first and second joining members and the bumper member are arranged to resiliently deflect to enable said portion of said structure to be received in said opening.

9. (Previously presented) A protecting apparatus according to claim 1 wherein said at least one joining portion joins to the respective bumper member and structure positioning member at respective zones of connection so as to minimize stress concentrations in the protecting apparatus.

10. (Currently amended) A protecting apparatus according to claim 9 wherein said stress concentrations are ~~minimised~~ minimized by curving the zones of connection.

11. (Previously presented) A protecting apparatus according to claim 1 wherein a tongue is located at or adjacent to each of the first and second ends of the bumper member, said tongues being arranged in use to contact the structure when it is received in said opening and to facilitate retention of the protecting apparatus about said structure.

12. (Original) A protecting apparatus according to claim 11 wherein a further tongue is provided on each of the first and second joining members to further facilitate retention of the protecting apparatus about said structure.

13. (Previously presented) A protecting apparatus according to claim 11 wherein the tongues are resiliently flexible and arranged so that they are deflected in order to receive the portion of the structure within the opening and, once the portion of the structure is located in the opening, arranged to engage against the structure.

14. (Canceled)

15. (Previously presented) A protecting apparatus according to claim 1 arranged to be retained tightly on the structure or to be retained in a manner which allows it to be slid along a length thereof.

16. (Previously presented) A protecting apparatus according to claim 1 wherein the bumper member is configured so as to extend about a major portion of the structure so as to protect as much of the structure as possible.

17. (Previously presented) A protecting apparatus according to claim 1 wherein the outer surface of the bumper member is smooth and continuous.

Application No.: 10/579,659
Filing Date: May 11, 2007

18. (Previously presented) A protecting apparatus according to claim 1 wherein the bumper member, structure positioning member, first and second joining members and said at least one joining portion are integrally formed.

19. (Currently amended) A protecting apparatus according to claim 18 wherein the protecting apparatus in ~~moulded~~ molded as a single piece in a plastics material.

20. (Previously presented) A protecting apparatus according to claim 1 arranged so that a plurality of such protecting apparatus can be stacked one on top of the other along a length of the structure.
